Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

A.Accession: JC5032
A.Status: preliminary
A.Rolecule type: protein
A.Residues: 1-247 < KON>
C.Comment: This protein belongs to type I ribosomal-inactivating proteins which catalytic
C.Superfamily: rRNA N-glycosidase; rRNA N-glycosidase homology
F;4-243/Domain: rRNA N-glycosidase homology < RNG>
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        C;Accession: JC5032

A;Title: Nucleotide sequence of cDNA encoding beta-luffin, another ribosome-inactivating A;Reference number: $23519; MUID:92353400; PMID:1643290
A;Accession: $23519
                                                                                                              abrin (clone 7.2) precursor - Indian licorice (fragment)
N;Contains: rRNA N-glycosidase (EC 3.2.2.2)
C;Species: Abrus precatorius (Indian licorice)
C;Date: 21-Feb-1992 #sequence_revision 31-Dec-1993 #text_change 20-Aug-1999
C;Accession: C39761; S14471.

A, Experimental seged
C, Comment: Abrin-a is more toxic than ricin. The toxin consists of an A chain, which inh circin rank brin-a is more toxic than ricin. The A and B chains are linked by a single disulfication; programming receptors on the cell surface. The A and B chains are linked by a single disulficianing receptors on the cell surface. The A and B chains are linked by a single disulficianing acid cyloperfored; all appropriate and B, and B, and B, and B, and B, and B, and B, and B, and B, and B, and B, and B, and B, and B, and B, and B, and B, and B, and B, and B, and B, and B, and B, and B, and B, and B, and B, and B, and B, and B, and B, and B, and B, and B, and B, and B, and B, and B, and B, and B, and B, and B, and B, and B, and B, and B, and B, and B, and B, and B, and B, and B, and B, and B, and B, and B, and B, and B, and B, and B, and B, and B, and B, and B, and B, and B, and B, and B, and B, and B, and B, and B, and B, and B, and B, and B, and B, and B, and B, and B, and B, and B, and B, and B, and B, and B, and B, and B, and B, and B, and B, and B, and B, and B, and B, and B, and B, and B, and B, and B, and B, and B, and B, and B, and B, and B, and B, and B, and B, and B, and B, and B, and B, and B, and B, and B, and B, and B, and B, and B, and B, and B, and B, and B, and B, and B, and B, and B, and B, and B, and B, and B, and B, and B, and B, and B, and B, and B, and B, and B, and B, and B, and B, and B, and B, and B, and B, and B, and B, and B, and B, and B, and B, and B, and B, and B, and B, and B, and B, and B, and B, and B, and B, and B, and B, and B, and B, and B, and B, and B, and B, and B, and B, and B, and B, and B, and B, and B, and B, and B, and B, and B, and B, and B, and B, and B, and B, and B, and B, and B, and B, and B, and B, and B, and B, and B, and B, and B, and B, and B, and B, and B, and B, and B,

"Manalysis of Several Key active site residues of ricin A chain by

"matagenesis and X-ray crystallography.";

Drotein Eng. 5:775-779(1992).

-!-FUNCTION: Ricin is highly toxic to animal cells and to a less extent to plant cells. The A chain is responsible for inhibiting protein synthesis through the catalytic inactivation of 605 ribosomal subunits. It acts as a glycosidase that removes a specific adenine residue from an exposed loop of 288 ribosomal RNA. As this loop is involved in the binding of elongation sporthesis. The A chain can inactivate a few thousand ribosomes per minute, thus inactivating them faster than the cell can make new ones. A single A-chain molecule can therefore kill an animal cell. The B chain binds to cell receptors and facilitates the entry into the cell of the A chain; B chains are also responsible for contractive and statistic cell agolithmian molecule. It is binds to beta-D-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            CATALYTIC ACTIVITY: Endohydrolysis of the N-glycosidic bond at one specific adenosine on the 28S rRNA.
SUBDIAT: Disulfided-linked dimer of A and B chains.
DOMAIN: The B chain is composed of two domains, each domain consists of 3 homologous subdomains (alpha, beta, gamma).
PTM: THE MAJOR A-CHAIN IS GLYCOSYLARTED ONLY IN POSITION 45 AND THE MINOR A-CHAIN IS GLYCOSYLARED ALSO IN POSITION 271.
SIMILARITY: IN THE N-TERMINAL SECTION; BELONGS TO THE RIBOSOME-INACTIVATING PROTEIN FAMILY: TYPE 2 RIP SUBFAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 "X-ray structure of recombinant ricin A-chain at 1.8-A resolution.";

"Studies on crystal structures, active-centre geometry and depurinating mechanism of two ribosome-inactivating proteins.";

Biochem. J. 309:288-298(1995).

-! - FUNCTION: TRICHOSANTHIN IS AN ABORTION-INDUCING PROTEIN. IT IS CAPABLE OF INMIBITING HIV-1 INFECTION AND REPLICATION. IT INACTIVATES EUKARYOTIC 60S RIBOSOMAL SUBUNITS.

-! - CAPABLE OF CATIVITY: Endchydrolysis of the N-glycosidic bond at one specific adenosine on the 28S FRNA.

-! - SIMILARITY: BELONGS TO THE RIBOSOME-INACTIVATING PROTEIN FAMILY.

TYPE 1 RIP SUBFAMILY.
                                                                                                                                                                                                                                                                                      Chow T., Feldman R.A., Lovett M., Piatak M.;

Pharm. Bull. 39:1244-1249(1991).

-!- FUNCTION: ABORTION-INDUCING PROTEIN. IT INACTIVATES EUKARYOTIC

-()- FUNCTION: ABORTION-INDUCING PROTEIN.

-()- CATALYTIC ACTIVITY: Endohydrolysis of the N-glycosidic bond at one specific adenosine on the 28S rRNA.

-()- SIMILARITY: BELONGS TO THE RIBOSOME-INACTIVATING PROTEIN FAMILY.

TYPE 1 RIP SUBFAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Eukaryota, Viridiplantae, Streptophyta, Embryophyta, Tracheophyta,

J. Biochem. 198:723-732(1991).

-i- FUNCTION: THE A CHAIN IS RESPONSIBLE FOR INHIBITING PROTEIN

SYNTHESIS THROUGH THE CATALYTIC INACTIVATION OF 60S RIBOSOMAL

SYNTHESIS THROUGH THE CATALYTIC INACTIVATION OF 60S RIBOSOMAL

SUBUNITS BY REMOVING ADENINE FROM POSITION 4,324 OF 28 S RRNA. THE

B CHAIN IS A GALACTOSE-SPECIFIC LECTIN THAT FACILITATES THE

BINDING OF ABRIN TO THE CELL MEMBRANE THAT PRECEDES ENDOCYTOSIS.

-i- CATALYTIC ACTIVITY: Endohydrolysis of the N-glycosidic bond at one
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Wood K.A., Lord J.M., Wawrzynczak E.J., Piatak M.; "Preproabrin: genomic cloning, characterisation and the expression of the A-chain in Escherichia coli.";

-- SUBUNT: DISULFIDE-LINKED DIMER OF A AND B CHAINS.
-- DOMAIN: THE B CHAIN IS COMPOSED OF TWO DOMAINS, EACH DOMAIN
CONSISTS OF 3 HOMOLOGOUS SUBDOMAINS (ALPHA, BETA, GAMMA).
-- SIMILARITY: IN THE N-TERMINAL SECTION, BELONGS TO THE RIBOSOME-INACTIVATING PROTEIN FAMILY: TYPE 2 RIP SUBFAMILY.
-- SIMILARITY: Contains 2 ricin B-type lectin domains.

The complete amino acid sequences of the B-chains of abrin-a and abrin-b, toxic proteins from the seeds of Abrus precatorius.";

Biosci. Biotechnol. Biochem. 57:166-1691933).

-!- FUNCTION: THE A CHAIN IS REPONSIBLE FOR INHIBITING PROTEIN SYNTHESIS THROUGH THE CATALYTIC INACTIVATION OF 60S RIBOSOWAL SYNTHESIS THROUGH THE CATALYTIC INACTION 4,324 OF 28 S RRNA. ABRIN-A IS MORE TOXIC THAN RICIN.

-!- FUNCTION: THE B CHAIN IS A GALACTOSE-SPECIFIC LECTIN THAT PROCEEDES ENDOCYTOSIS.

-!- FUNCTION: THE B CHAIN IS A GALACTOSE-SPECIFIC LECTIN THAT PROCEEDES ENDOCYTOSIS.

-!- CATALYTIC ACTIVITY: Endohydrolysis of the N-glycosidic bond at one specific adenosine on the 28S FRNA.

-!- CATALYTIC ACTIVITY: Endohydrolysis of the N-glycosidic bond at CONSISTS OF 3 HOMOLOGOUS SUBDOMAINS (ALPHA, BETA, DAMAIN).

-!- DOWALN: THE B CHAIN IS COMPOSED OF TWO DOMAINS, EACH DOMAIN CONSISTS OF 3 HOMOLOGOUS SUBDOMAINS (ALPHA, BETA, GAMMA).

-!- SIMILARITY: IN THE N-TERMINAL SECTION; BELONGS TO THE RIBOSOME-

-!- SIMILARITY: COLTAINS 2 FICIN B-type lectin domains.
                                                                                                                                                                                                                                                                                                                                                                  one
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           BY SIMILARITY.

-!- FUNCTION: RIBOSOME-INACTIVATING PROTEIN OF TYPE 1, INHIBITS
-!- FUNCTION: RIBOSOME-INACTIVATING PROTEIN SYNTHESIS IN ANIMAL CELLS (BY SIMILARITY).
-!- CATALYTIC ACTIVITY: Endohydrolysis of the N-glycosidic bond at on specific adenosine on the 28S rRNA.
-!- SIMILARITY: BELONGS TO THE RIBOSOME-INACTIVATING PROTEIN FAMILY.
TYPE 1 RIP SUBFAMILY.
                                                                                                                                                                                    Gaps

SUBUNIT: DISULFIDE-LINKED DIMER OF A AND B CHAINS.
SIMILARITY: IN THE N-TERMINAL SECTION; BELONGS TO THE RIBOSOME-INACTIVATING PROFER FAMILY. TYPE 2 RIP SUBFAMILY.
SIMILARITY: Contains 2 ricin B-type lectin domains.
           SYNTHESIS. THE A CHAIN IS RESPONDIBLE FOR INHIBITING PROTEIN SYNTHESIS THROUGH THE CATALYTIC INACTIVATION OF 60S RIBOSOWAL SUBUNITS BY REMOVING ADENINE FROM POSITION 4,324 OF 28 S. RRNA. B CHAIN IS A GALACTOSE-SPECIFIC LECTIN THAT FACILITATES THE BINDING OF NIGRIN B TO THE CELL MEMBRANE THAT PRECEDES

Protein from sponge gourd (Luffa Cylindrica) seeds.";

-!- CATALYTIC ACTIVITY: Endohydrolysis of the N-glycosidic bond at or specific adenosine on the 28S rRNA.

-!- SIMILARITY: BELONGS TO THE RIBOSOME-INACTIVATING PROTEIN FAMILY.

TYPE I RIP SUBFAMILY.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Kataoka J., Habbika N., Miyano M., Masuta C., Koiwai A.;
"Nucleotide sequence of cDNA encoding alpha-luffin, a ribosome-
inactivating protein from Luffac cylindrica.";
Plant Mol. Biol. 18:1199-1202 (1992).
-!- CATALYTIC ACTIVITY: Endohydrolysis of the N-glycosidic bond at one
specific adenosine on the 28S rRNA.
-!- SIMILARITY: BELONGS TO THE RIBOSOME-INACTIVATING PROTEIN FAMILY.
TYPE I RIP SUBFAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  22 VRFSLSGSSSTSYSKFIGDLRKALPSN-GTVYNITLLLSSASGASRYTLMTLSNYDGKAI

THE B CHAIN BINDS TO CELL RECEPTORS AND PROBABLY FACILITATES THE ENTRY INTO THE CELL OF THE A CHAIN, B CHAINS ARE ALSO RESPONSIBLE FOR CELL AGGLUTINATION (LECTIN ACTIVITY)
                                                                                                                                                                                                                                                                                                                                    -!- CATALYTIC ACTIVITY: Endohydrolysis of the N-glycosidic bond at one specific adenosine on the 28S rRNA.
-!- SUBUNIT: Disulfide-linked dimer of A and B chains.
-!- PHARMACEUTICAL: Due to its immunomodulative effects it is being studied in clinical trials in cancer patients as it may slow the growth of cancer cells and be an effective treatment for solid
                                                                                                                                                                                                                         "Complete amino acid sequence of the A chain of mistletoe lectin I."; FEBS Lett. 399:153-157(1996).

                                                                                                                                                                                                                                                                                                                                                                                                                                                                    1 IFPKQYPIINFTTAGATVQSYTNFIRAVRGRLTTGADVRHEIPVLPNRVGLPINQRFILV 60
                                                                                                   The invention covers analogues of Type I RIPs. Ricin is a Type II RIPs whose A chain is homologous to plant type I RIPs. The analogues of the invention have a cysteine available for intermolecular disulphide bonding at an amino acid position corresp. to a position not naturally available for bonding; the cys residue is located in the C-terminal region of the analogue between a position corresp. to amino acid 251 and the C-terminus of ricin A chain. The analogues are pref. joined via a disulphide linkage to a molecule which specifically binds to a target cell, e.g. an antibody fragment.

(Updated on 09-JAM-2003 to correct PN field.)
Analogues of type I ribosome inactivating protein - useful as cytotoxic agents, immuno toxins for treating auto immune diseases, cancer, graft versus host disease and selective cell killing in=vivo
                                                                                                                                                                                                                                                                                                                                                                                                  Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Polynucleotide(s) encoding type I ribosome-inactivating proteins

                                                                                         AAR63902 is the ricin A chain gene product, it is analogous to the ribosome-inactivating proteins (RIPs) described in AAR63903-R63911. RIPs are the key components of cytotoxic therapeutic agents (CTAs),
                                                                                                                                           which include gene fusion products and immunoconjugates. CTAs may be used to selectively eliminate any cell type to which a RIP component is targetted, by the specific binding capacity of the second component of the agent. They can be used in the treatment of diseases where the elimination of a particular cell type is
                                                                                                                                                                                                                                          desired, such as autoimmune disease, cancer and graft-versus-host
